crystalline

Page 167 Paragraph 3 line 2 Wrong letter F, G, silica.

Page 166 Paragraph 12-19 8 Missing Paragraphs Measurements and Des

cription. The specimens in this type are basically leaf-shaped in outline, with a rounded base, convex edges, and blunt tips. Some of the specimens from Cultural Component III have one nearly straight edge and one noticeably convex edge (Fig. 12, i-j). All are crudely made, having a thick lenticular or plano-convex cross section.

Page 166 Paragraph 12-19 8 Missing paragraphs (cont.)

Only one is complete, measuring 6.1 x 3.2 x 1.1 cm. Others may have attained a length of as much as 8.0 or 9.0 cm. and a width of 4.5 cm.

Technique of manufacture The specimens in this type are the product of percussion flaking.

Comments. Unfortunately, this type must rest almost entirely upon its distribution within the deposits at 45KT28, where it is a characteristic artifact in all the phases but the very latest. Comparative specimens are restricted to Olcott type materials found along the Puget Sound littoral (Butler 1961; Thompson 1961).

Distribution.
